1 Introduction

The following document details the Module Interface Specifications for the implemented modules in the program Glass-BR. It is intended to ease navigation through the program for design and maintenance purposes. Complementary documents include the [System Requirement Specifications](#) (SRS) and [Module Guide](#) (MG). The full documentation and implementation can be found at <https://github.com/smiths/caseStudies/tree/master/CaseStudies/glass>.

2 Notation

The structure of the MIS for modules comes from [Hoffman and Strooper \(1995\)](#), with the addition that template modules have been adapted from [Ghezzi et al. \(2003\)](#). The mathematical notation comes from Chapter 3 of [Hoffman and Strooper \(1995\)](#). For instance, the symbol $:=$ is used for a multiple assignment statement and conditional rules follow the form $(c_1 \Rightarrow r_1 | c_2 \Rightarrow r_2 | \dots | c_n \Rightarrow r_n)$.

The following table summarizes the primitive data types used by Glass-BR

Data Type	Notation	Description
character	char	a single symbol or digit
integer	\mathbb{Z}	a number without a fractional component in $(-\infty, \infty)$
natural number	\mathbb{N}	a number without a fractional component in $[1, \infty)$
real	\mathbb{R}	any number in $(-\infty, \infty)$
string	\mathbb{S}	all finite sequences of symbols from the ASCII character set

The specification of Glass-BR uses some derived data types: sequences, strings, and tuples. Sequences are lists that represent a countable number of ordered values of the same data type, where the same value may occur more than once. Strings are sequences of characters. Tuples contain a list of values, potentially of different types. In addition, Glass-BR uses functions, which are defined by the data types of their inputs and outputs. Local functions are described by giving their type signature followed by their specification.

3 Module Hierarchy

To view the Module Hierarchy, see section 3 of the [MG](#).

4 MIS of Control Module

4.1 Module

Control

4.2 Uses

Input (Section 5), LoadASTM (Section 6), Calc (Section 7), Output (Section 13)

4.3 Syntax

4.3.1 Exported Constants

sTSD = # String for path and filename for TSD file
sSDF = # String for path and filename for SDF file
sIn = # String for path and filename for Input file
sOut = # String for path and filename for Output file

4.3.2 Exported Access Programs

Name	In	Out	Exceptions
main	-	-	-

4.4 Semantics

4.4.1 State Variables

None

4.4.2 Access Routine Semantics

main():

- transition: Modify the state of Param module and the environment variables for the Plot and Output modules by following these steps.
 - $cTSD = \text{LoadASTM.LoadTSD}(sTSD)$
 - $cSDF = \text{LoadASTM.LoadSDF}(sSDF)$
 - $\text{Input.load_params}(sIn)$
 - $q = cTSD.\text{eval}(\text{Input.SD}, \text{Input}.w * \text{Input.TNT})$ # From SRS IM3
 - $\hat{q} = \text{Calc.calc_q_hat}(q)$
 - $J_{tol} = \text{Calc.calc_J_tol}()$
 - $J = cSDF.\text{evaly}(\text{Input.AR}, \hat{q})$ # From SRS DD4

- $\hat{q}_{\text{tol}} = \text{cSDF.eval}(\text{Input.AR}, J_{\text{tol}}) \# \text{ From SRS DD8}$
- $B = \text{Calc.calc_B}(J)$
- $P_b = \text{Calc.calc_Pb}(B)$
- $\text{NFL} = \text{Calc.calc_NFL}(\hat{q}_{\text{tol}})$
- $\text{LR} = \text{Calc.calc_LR}(\text{NFL})$
- $\text{is_safePb} = \text{Calc.calc_is_safePb}(P_b)$
- $\text{is_safeLR} = \text{Calc.calc_is_safeLR}(\text{LR}, q)$
- $\text{Output.output}(\text{sOut}, \text{is_safePb}, \text{is_safeLR}, P_b, B, \text{LR}, q, J, \text{NFL}, \hat{q}, \hat{q}_{\text{tol}}, J_{\text{tol}})$
- $\text{print}(\text{"Main has been executed and the results have been written to " + sOut})$

5 MIS of Input Module

The secrets of this module are the data structure for input parameters, how the values are input and how the values are verified. The load and verify secrets are isolated to their own access programs. This module follows the singleton pattern; that is, there is only one instance of this module.

5.1 Module

Input

5.2 Uses

GlassTypeADT (Section 8), ThicknessADT (Section 9), Constants (Section 14), Hardware (Section 15)

5.3 Syntax

Name	In	Out	Exceptions
load_params	string	-	FileError
verify_params	-	-	ValueError
a	-	\mathbb{R}	
b	-	\mathbb{R}	
w	-	\mathbb{R}	
$P_{b_{tol}}$	-	\mathbb{R}	
TNT	-	\mathbb{R}	
SD_x	-	\mathbb{R}	
SD_y	-	\mathbb{R}	
SD_z	-	\mathbb{R}	
g	-	GlassTypeT	
t	-	ThicknessT	
m	-	\mathbb{R}	
k	-	\mathbb{R}	
E	-	\mathbb{R}	
t_d	-	\mathbb{R}	
LDF	-	\mathbb{R}	
LSF	-	\mathbb{R}	
h	-	\mathbb{R}	
GTF	-	\mathbb{R}	
SD	-	\mathbb{R}	
AR	-	\mathbb{R}	

5.4 Semantics

5.4.1 Environment Variables

inputFile: sequence of string $\#f[i]$ is the i th string in the text file f

5.4.2 State Variables

$\#$ From SRS R1

$a: \mathbb{R}$

$b: \mathbb{R}$

$w: \mathbb{R}$

$P_{b_{tol}}: \mathbb{R}$

TNT: \mathbb{R}

$SD_x: \mathbb{R}$

$SD_y: \mathbb{R}$

$SD_z: \mathbb{R}$

g : GlassTypeT

t : ThicknessT

$\#$ From SRS R2

$m: \mathbb{R}$

$k: \mathbb{R}$

$E: \mathbb{R}$

$t_d: \mathbb{R}$

LDF: \mathbb{R}

LSF: \mathbb{R}

$h: \mathbb{R}$

GTF: \mathbb{R}

SD: \mathbb{R}

AR: \mathbb{R}

5.4.3 Assumptions

- load_params will be called before the values of any state variables will be accessed.
- The file contains the string equivalents of the numeric values for each input parameter in order, each on a new line. The order is the same as in the table in R1 of the SRS. Any comments in the input file should be denoted with a '#' symbol.

5.4.4 Access Routine Semantics

a:

- output: $out := a$
- exception: none

b:

- output: $out := b$
- exception: none

...

GTF:

- output: $out := \text{GTF}$
- exception: none

load_params(*s*):

- transition: The filename *s* is first associated with the file f. inputFile is used to modify the state variables using the following procedural specification:
 1. Read data sequentially from inputFile to populate the state variables from SRS R1 (*a* to *w*).
 2. Calculate the derived quantities (all other state variables, from SRS R2) as follows:
 - m, k, E, t_d, LSF as defined in Constants (Section 14)
 - $\text{LDF} = (\frac{t_d}{60})^{m/16} \# \text{From SRS DD3}$
 - $h = t.\text{toMinThick}()$ (Section 9)
 - $\text{GTF} = g.\text{GTF}()$ (Section 8)
 - $\text{SD} = \sqrt{\text{SD}_x^2 + \text{SD}_y^2 + \text{SD}_z^2} \# \text{From SRS DD10}$
 - $\text{AR} = a/b \# \text{From SRS DD11}$
 3. verify_params()
- exception: $\text{exc} := \text{a file name } s \text{ cannot be found OR the format of inputFile is incorrect} \Rightarrow \text{FileError}$

verify_params():

- out: $out := \text{none}$
- exception: $\text{exc} := \# \text{From the SRS Table 2, R3}$

$\neg(a > 0)$	\Rightarrow ValueError(“dimension a must be positive”)
$\neg(\text{AR} \geq 0)$	\Rightarrow ValueError(“ a must be equal to, or greater than, b ”)
$\neg(d_{\min} \leq a \leq d_{\max})$	\Rightarrow ValueError(“ a too large or small”)
$\neg(\text{AR} < \text{AR}_{\max})$	\Rightarrow ValueError(“Allowable aspect ratio exceeded”)
$\neg(b > 0)$	\Rightarrow ValueError(“dimension b must be positive”)
$\neg(d_{\min} \leq b \leq d_{\max})$	\Rightarrow ValueError(“ b too large or small”)
$\neg(0 < P_{\text{tol}} < 1)$	\Rightarrow ValueError(“ P_{tol} must lie between 0 and 1”)
$\neg(w \geq 0)$	\Rightarrow ValueError(“charge weight w must be greater or equal to zero”)
$\neg(w_{\min} < w < w_{\max})$	\Rightarrow ValueError(“charge weight w is too small or too large”)
$\neg(\text{TNT} > 0)$	\Rightarrow ValueError(“TNT must be positive”)
$\neg(\text{SD} > 0)$	\Rightarrow ValueError(“stand off distance (SD) must be positive”)
$\neg(\text{SD}_{\min} < \text{SD} < \text{SD}_{\max})$	\Rightarrow ValueError(“stand off distance (SD) is too small or too large”)

5.5 Considerations

The value of each state variable can be accessed through its name (getter). An access program is available for each state variable. There are no setters for the state variables, since the values will be set and checked by load params and not changed for the life of the program.

6 MIS of LoadASTM Module

6.1 Module

LoadASTM

6.2 Uses

FunctADT (Section 10), ContoursADT (Section 11)

6.3 Syntax

6.3.1 Exported Constants

None

6.3.2 Exported Access Programs

Routine name	In	Out	Exceptions
LoadTSD	$s : \text{string}$	ContoursT	FileError
LoadSDF	$s : \text{string}$	ContoursT	FileError

6.4 Semantics

6.4.1 Environment Variables

infile: two dimensional sequence of text characters

6.4.2 State Variables

None

6.4.3 State Invariant

None

6.4.4 Assumptions

The input file will match the given specification.

6.4.5 Access Routine Semantics

LoadTSD(s)

- output: Create *out* following the following steps. Read data from the file infile associated with the string *s*. Use this data to create a ContoursT object. For each value of *w* create an object of FunctT and add it to the ContoursT object. Each of the FunctT objects will consist of *q* versus SD data. The first row of the TSD file contains the values of *w*. The subsequent columns are grouped in pairs. Each pair corresponds to a column of SD data and a column of *q* data. There is a pair of columns in this pattern for each value of *w*.
- exception: exc := a file name *s* cannot be found OR the format of inputFile is incorrect
⇒ FileError

LoadSDF(*s*)

- output: Create *out* following the following steps. Read data from the file infile associated with the string *s*. Use this data to create a ContoursT object. For each value of *J* create an object of Funct T and add it to the ContoursT object. Each of the FunctT objects will consist of q^* versus AR data. The first row of the SDF file contains the values of *J*. The subsequent columns are grouped in pairs. Each pair corresponds to a column of AR data and a column of q^* data. There is a pair of columns in this pattern for each value of *J*.
- exception: exc := a file name *s* cannot be found OR the format of inputFile is incorrect
⇒ FileError

7 MIS of Calc Module

7.1 Module

Calc

7.2 Uses

Input (Section 5), ContoursADT (Section 11), Constants (Section 14)

7.3 Syntax

7.3.1 Exported Constants

None

7.3.2 Exported Access Programs

Routine name	In	Out	Exceptions
calc_q_hat	$q : \mathbb{R}$	\mathbb{R}	-
calc_J_tol		\mathbb{R}	-
calc_Pb	$B : \mathbb{R}$	\mathbb{R}	InvalidOutput
calc_B	$J : \mathbb{R}$	\mathbb{R}	-
calc_NFL	$\hat{q}_{\text{tol}} : \mathbb{R}$	\mathbb{R}	-
calc_LR	$\text{NFL} : \mathbb{R}$	\mathbb{R}	-
calc_is_safePb	$P_b : \mathbb{R}$	\mathbb{B}	-
calc_is_safeLR	$\text{LR} : \mathbb{R}, q : \mathbb{R}$	\mathbb{B}	-

7.4 Semantics

7.4.1 State Variables

None

7.4.2 State Invariant

None

7.4.3 Assumptions

None

7.4.4 Access Routine Semantics

$\text{calc_q_hat}(q)$ # From SRS DD7 Dimensionless Load (\hat{q})

- output: $out := \frac{q(ab)^2}{Eh^4GTF}$
- exception: None

$\text{calc_J_tol}()$ # From SRS DD9 Tolerable Stress Distribution Factor (J_{tol})

- output: $out := \ln[\ln(\frac{1}{1-P_{b_{tol}}}) \frac{(a \times b)^{m-1}}{k(Eh^2)^m LDF}]$
- exception: None

$\text{calc_Pb}(B)$ # From SRS IM1 Probability of Glass Breakage

- output: $out := 1 - e^{-B}$
- exception: $\neg(0 < (1 - e^{-B}) < 1) \Rightarrow \text{InvalidOutput}$ # From SRS Table 3, Output Variables

$\text{calc_B}(J)$ # From SRS DD1 Risk of Failure (B)

- output: $out := \frac{k}{(a \times b)^{m-1}} (Eh^2)^m \times LDF \times e^J$
- exception: None

$\text{calc_NFL}(\hat{q}_{tol})$ # From SRS DD5 Non-Factored Load

- output: $out := \frac{\hat{q}_{tol} Eh^4}{(ab)^2}$
- exception: None

$\text{calc_LR}(\text{NFL})$ # From SRS IM2 Calculation of Capacity (LR)

- output: $out := \text{NFL} \times GTF \times LSF$
- exception: None

$\text{calc_is_safePb}(P_b)$ # From SRS T1 Safety Req-Pb)

- output: $out := P_b < P_{b_{tol}}$
- exception: None

$\text{calc_is_safeLR}(\text{LR}, q)$ # From SRS T2 Safety Req-LR)

- output: $out := \text{LR} > q$
- exception: None

8 MIS of GlassType ADT Module

From DD6 (Glass Type Factor (GTF))

8.1 Template Module

GlassTypeADT

8.2 Uses

None

8.3 Syntax

8.3.1 Exported Constants

None

8.3.2 Exported Types

GlassTypeT = ?

new ThicknessT	\mathbb{R}	ThicknessT	ValueError
toMinThick		\mathbb{R}	
toFloat		\mathbb{R}	

9.4 Semantics

9.4.1 State Variables

$t : T$ where $T = \{2.5, 2.7, 3.0, 4.0, 5.0, 6.0, 8.0, 10.0, 12.0, 16.0, 19.0, 22.0\}$

9.4.2 State Invariant

None

9.4.3 Assumptions

None

9.4.4 Access Routine Semantics

new ThicknessT(x):

- transition: $t := x$
- output: $out := self$
- exception: $(\neg(x \in T) \Rightarrow \text{ValueError})$

toMinThick():

- output:

$t = 2.5 \Rightarrow 2.16$	$t = 2.7 \Rightarrow 2.59$	
$t = 3.0 \Rightarrow 2.92$	$t = 4.0 \Rightarrow 3.78$	
$t = 5.0 \Rightarrow 4.57$	$t = 6.0 \Rightarrow 5.56$	
$t = 8.0 \Rightarrow 7.42$	$t = 10.0 \Rightarrow 9.02$	
$t = 12.0 \Rightarrow 11.91$	$t = 16.0 \Rightarrow 15.09$	
$t = 19.0 \Rightarrow 18.26$	$t = 22.0 \Rightarrow 21.44$)
- exception: None

toFloat():

- output: $out := t$
- exception: None

10 MIS of FunctADT Module

10.1 Template Module

FunctADT

10.2 Uses

SeqServices (Section 12)

10.3 Syntax

10.3.1 Exported Constants

MAX_ORDER = 2

10.3.2 Exported Types

FunctT = ?

10.3.3 Exported Access Programs

Routine name	In	Out	Exceptions
new FunctT	$X_{\text{in}} : \mathbb{R}^n, Y_{\text{in}} : \mathbb{R}^n, i : \mathbb{N}$	FunctT	IndepVarNotAscending, SeqSizeMismatch, InvalidInterpOrder, TooFewDataPts
minD		\mathbb{R}	
maxD		\mathbb{R}	
order		\mathbb{N}	
eval	$x : \mathbb{R}$	\mathbb{R}	OutOfDomain

10.4 Semantics

10.4.1 State Variables

X: \mathbb{R}^n

Y: \mathbb{R}^n

minx: \mathbb{R}

maxx: \mathbb{R}

o: \mathbb{N}

10.4.2 State Invariant

None

10.4.3 Assumptions

None

10.4.4 Access Routine Semantics

new FunctT($X_{\text{in}}, Y_{\text{in}}, i$):

- transition: $X, Y, \text{minx}, \text{maxx}, o := X_{\text{in}}, Y_{\text{in}}, X_{\text{in}}[0], X_{\text{in}}[|X| - 1], i$
- output: $\text{out} := \text{self}$
- exception: $(\neg \text{isAscending}(X_{\text{in}}) \Rightarrow \text{IndepVarNotAscending} || X_{\text{in}}| \neq |Y_{\text{in}}| \Rightarrow \text{SeqSizeMismatch} | i \notin [1.. \text{MAX_ORDER}] \Rightarrow \text{InvalidInterpOrder} || X_{\text{in}}| < 3 \Rightarrow \text{TooFewDataPts})$

minD():

- output: $\text{out} := \text{minx}$
- exception: None

maxD():

- output: $\text{out} := \text{maxx}$
- exception: None

order():

- output: $\text{out} := o$
- exception: None

eval(x):

- output: $\text{out} :=$
 $(o = 1 \Rightarrow \text{interpLin}(X_i, Y_i, X_{i+1}, Y_{i+1}, x) | o = 2 \Rightarrow \text{interpQuad}(X_{i-1}, Y_{i-1}, X_i, Y_i, X_{i+1}, Y_{i+1}, x))$
where $i = \text{index}(X, x)$
- exception: $(\neg(\text{minx} \leq x \leq \text{maxx}) \Rightarrow \text{OutOfDomain}) | \neg(1 \leq \text{index}(X, x) \leq |X| - 2) \Rightarrow \text{OutOfDomain}) \neq \text{first check if within domain, then make sure not too close to edge, so quadratic interpolation is defined}$

10.5 Considerations

For simplicity the function evaluation is not defined within one step of the boundaries. By considering the special cases it would be possible to get right to the edge.

11 MIS of ContoursADT Module

11.1 Template Module

ContoursADT

11.2 Uses

FunctADT (Section 10) for FunctT

11.3 Syntax

11.3.1 Exported Constants

MAX_ORDER = 2

11.3.2 Exported Types

ContoursT = ?

11.3.3 Exported Access Programs

Routine name	In	Out	Exceptions
new ContoursT	$i : \mathbb{R}$		InvalidInterpOrder
add	$s: \text{FunctT}, z : \mathbb{R}$		IndepVarNotAscending
getC	$i : \mathbb{N}$		InvalidIndex
